

## Cleaning Validation: Factors Affecting Recovery Data and Material of Construction Grouping

**May 15, 2013 8:05 am EDT**

Materials of construction used in laboratory studies to represent commercial manufacturing equipment must be representative of equipment. Materials of construction that exhibit low recovery should be replaced wherever practical for an alternative material with a higher recovery to avoid any potential cross-contamination due to slow release of residue from the material of construction. If problematic materials cannot be released, equipment should be dedicated or restricted for use to the active pharmaceutical ingredient with low recovery.
