

Continued Process Verification

By **Jan 10, 2015**

The FDA guidance described three stages in the lifecycle approach including Process Design, Process Qualification, and Continued Process Verification (CPV). The CPV stage of the lifecycle approach is the final stage, which continues throughout the entire commercial life of the product process—it never ends. *Continuous* Process Verification is an approach to process validation in which manufacturing process performance is continuously monitored and evaluated to provide real-time evidence that the process is under control.
